-- Abstract

10 A device for preventing sedimentation by regulating the flow
of waste water through drain draining-wells, with or without a
pump. The device has of a swirl chamber with connected outlet
pipe and provided with an air injector. The swirl chamber
which is tapered, generates a vortex flow in which the air
added by the air injector gives the sludge particles a certain
amount of buoyancy, making it easier for them to accompany the
15 water flow without being precipitated.--
